

Super Market Billing System | Python

The image shows a Python IDE window titled 'python_learn'. The editor displays a file named 'supermarket.py' with the following code:

```
week_1 > supermarket.py > ...
1  # =====
2  #      SUPER MARKET BILLING SYSTEM
3  # =====
4
5  from datetime import datetime
6
7  print("=" * 50)
8  print("      WELCOME TO SUPER MARKET")
9  print("=" * 50)
10
11 # Customer Details
12 customer_name = input("Enter Customer Name : ")
13
14 # Current Date and Time
15 current_time = datetime.now()
16 date = current_time.strftime("%d-%m-%Y")
17 time = current_time.strftime("%H:%M:%S")
18
19 print("\nDate :", date)
20 print("Time :", time)
21 print("-" * 50)
22
23 # Variables
24 cart = []
25 subtotal = 0
26
27 # Item Entry Loop
28 while True:
29
30     item = input("\nEnter Item Name : ")
31     quantity = int(input("Enter Quantity : "))
32     price = float(input("Enter Price per Item : "))
33
34     total = quantity * price
--
```

The IDE interface includes a menu bar (File, Edit, Selection, View, Go, Run, ...), a toolbar with icons for search, run, and other functions, and a sidebar with icons for file explorer, search, and other tools. The status bar at the bottom shows 5 errors and 0 warnings.

The image shows a code editor with a dark theme. The top menu bar includes 'File', 'Edit', 'Selection', 'View', 'Go', 'Run', and a search icon. The right side of the top bar shows a search bar with the text 'python_learn'. Below the menu bar, there are four tabs: 'xyz.py', 'pandas_t.ipynb', 'supermarket.py' (which is active), and 'emirate_project.py'. The left sidebar contains several icons: a magnifying glass, a network diagram, a gear, a grid, a flask, a Python logo, a person, and a settings gear. The main area displays the code for 'supermarket.py'. The code starts with a comment 'week_1 > supermarket.py > ...' and continues with a loop that appends items to a cart, calculates the subtotal, and asks if the user wants to add another item. It then calculates a discount based on the subtotal, calculates the GST (18%), and finally calculates the final amount. The code ends with a print statement for the final amount.

```
week_1 > supermarket.py > ...
35
36     cart.append([item, quantity, price, total])
37
38     subtotal += total
39
40     choice = input("Add another item? (yes/no): ")
41
42     if choice.lower() == "no":
43         break
44
45     # Discount Calculation
46     if subtotal > 5000:
47         discount = subtotal * 0.20
48     elif subtotal > 3000:
49         discount = subtotal * 0.10
50     elif subtotal > 1000:
51         discount = subtotal * 0.05
52     else:
53         discount = 0
54
55     amount_after_discount = subtotal - discount
56
57     # GST Calculation (18%)
58     gst = amount_after_discount * 0.18
59
60     # Final Amount
61     final_amount = amount_after_discount + gst
62
63     # =====
64     #             FINAL BILL
65     # =====
66
67     print("\n")
68     print("=" * 60)
69     print("SUPERMARKET BILL")
```

At the bottom left, there is a status bar showing a magnifying glass icon, a close icon, and the text '5 0'.

Python Concepts Applied:

- Variables and Data Types
- Input/Output Operations
- Conditional Statements (if-elif-else)
- Loops (while)
- Lists and Data Management
- Arithmetic Operations
- String Formatting (f-strings)
- Basic Business Logic and Automation

This project strengthened my understanding of Python programming and demonstrated how software can simplify real-world business operations through automation, structured logic, and efficient data handling. It also provides a foundation for future enhancements such as inventory management, database integration, sales analytics, and dashboard reporting.

Skills: Python · Problem Solving · Automation · Data Analytics · Business Logic · Command-Line Applications

Thank You

- Aarti Parihar
